

CLINICAL FINDINGS REGARDING RELAPSING MENINGITIS

Valentina Ionescu, Magdalena Peter, A.Cupşa, Silvia Munteanu

Clinic of Infectious Diseases,
Faculty of Medicine, Craiova

The seal of the Faculty of Medicine, Craiova, is circular and features a central emblem with a sunburst and wings. The text around the perimeter includes 'FACULTATEA DE MEDICINA CRAIOVA' and 'FACULTATEA DE FARMACIE, STIINTE SI TEHNOLOGII'.

12 cases of relapsing meningitis had been admitted and treated in the Clinical Hospital of Infectious Diseases Craiova between 1989-1994. The age range of the investigated subjects was between 17-64 ($47,2 \pm 16,8\%$), the

highest prevalence of infectious being registred at female (58,3%). The Pneumococcus was the etiologycal agent in 91,6% cases. The incidence of relapsing forms range between 2-14. The period between the start of the disease and the moment when the case is admitted in the Hospital is smaller 4597 ± 2343 comparative with other meningitis. The therapeutic response at Penicillin has been fast for each of the episode.
